Note. Although data were collected for Exam 1 in fall 2017, the response rate was too low and the questions were too different, so those data are not included in this study.

## TABLE 2

Correlations between study method usage and exam grades.

Note. Stars represent the level of significance, so all of these values have a $p$-value of less than 0.001 . To determine whether study methods are helpful or not, we compared the study method rating to the overall helpfulness rating. The helpfulness per student, per exam, and per semester were based on a student's individual rating, from the average rating for that exam, and from the average rating for that semester, respectively. The helpful and unhelpful groups remained consistent.
